ZNEXORA TECH | SECURITY BRIEFING

Phishing: Don't Take the Bait

Spot it. Stop it. Report it.

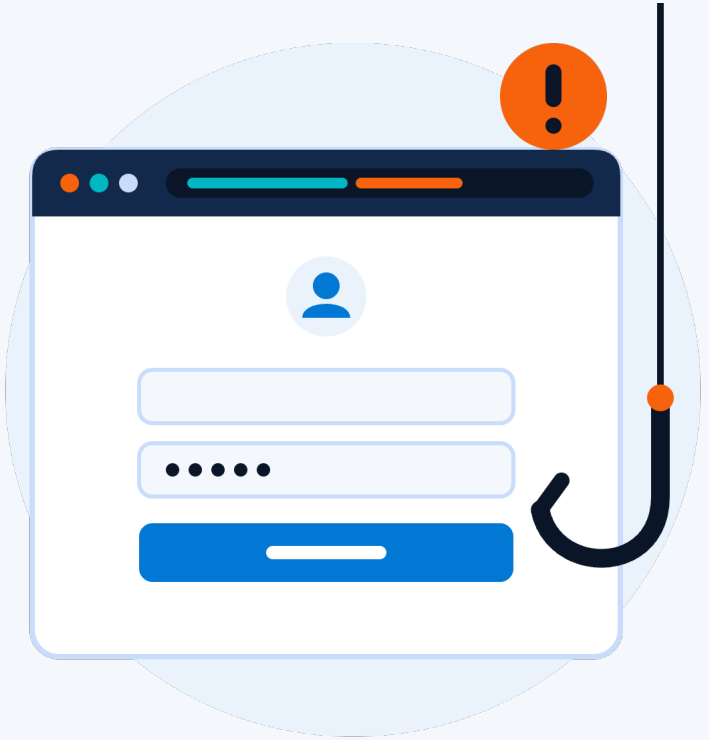

Presented by: **ZNexora Tech** · [Presenter] · [Date]

What is phishing?

A message that pretends to be someone you trust to trick you into acting.

Clicking a link, opening a file, **sharing a password** or **sending money**.

It targets **people**, not technology, so anyone can be fooled.

Phishing comes in many forms

Email phishing
Mass emails posing as trusted brands.

Spear phishing
Tailored messages aimed at you by name.

Smishing
Fake text messages, like parcel or bank alerts.

Vishing
Phone calls pretending to be IT, banks or officials.

QR code phishing
Codes on posters or emails leading to fake sites.

Business email compromise
Fake "boss" or supplier asking for payments.

What attackers want from you

Your login details

Usernames, passwords and MFA codes give them access to email, files and systems.

Money

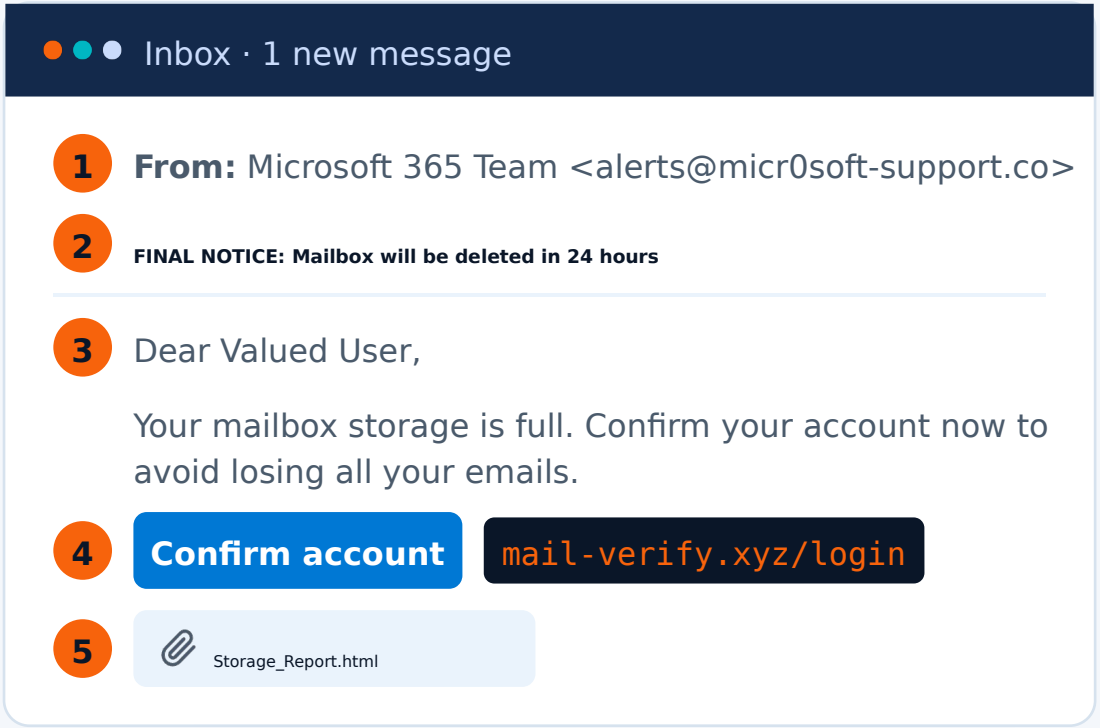

Fake invoices, changed bank details, gift cards and urgent transfers.

A way in

Malware or ransomware installed through an attachment or download.

Anatomy of a phishing email

1. **Look-alike sender**
   A zero for an "o", or an outside domain.
2. **Urgency or threats**
   "Final notice", "24 hours", "suspended".
3. **Generic greeting**
   Real services usually use your name.
4. **Mismatched link**
   Hover: the real address is somewhere else.
5. **Unexpected attachment**
   HTML, zip or macro files you didn't expect.

Check the link before you click

✓ `https://www.yourbank.com/login`
Real: the domain is yourbank.com

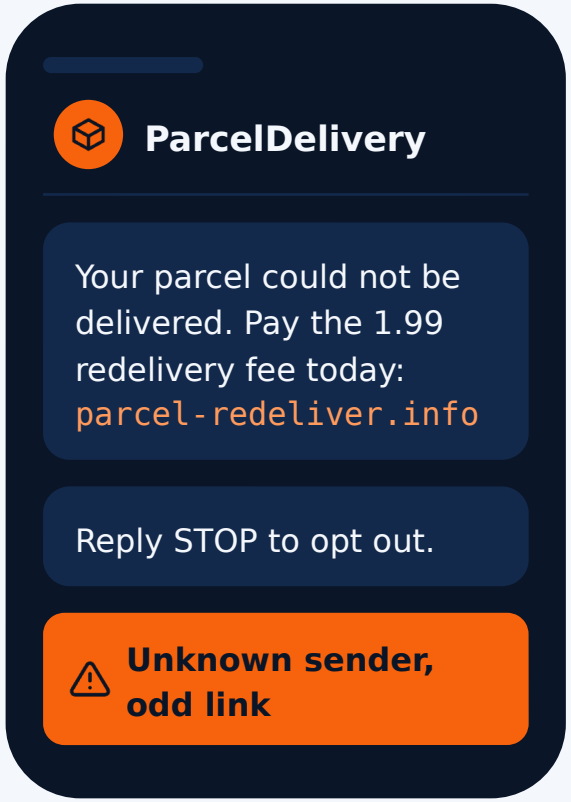

✗ `https://www.yourbank.com.secure-login.net/verify`
Fake: the real domain is secure-login.net

✗ `https://www.y0urbank.com/login`
Fake: a zero replaces the letter "o"

✗ `https://yourbank-support.co/account`
Fake: extra words and a different ending

Read the domain **just before the first single "/"**. Hover on a computer, long-press on a phone.

Beyond email: texts, calls, QR codes

Texts (smishing)

Don't tap links in unexpected texts. Open the official app or website yourself.

Calls (vishing)

Hang up and call back on a number you trust. IT will never ask for your password.

QR codes

Check the address before entering details. Watch for stickers over real codes.

THE GOLDEN RULE

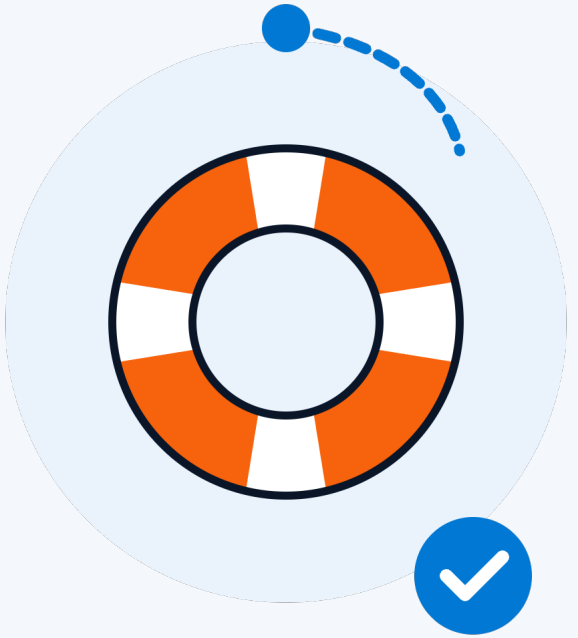

Stop.
Check.
Report.

If something feels off, it probably is.

Clicked by mistake? Act fast

1. **Stop** and don't enter any more information.
2. **Report it to IT immediately** on [contact]. Minutes matter.
3. **Change your password** from a trusted device, and anywhere you reused it.
4. **Follow IT's advice** if you opened an attachment, such as disconnecting.
5. **Watch for warning signs:** MFA prompts or sent emails you don't recognise.

Six habits that beat phishing

Pause on urgency

Pressure is a red flag. Take a moment.

Verify another way

Call the sender on a number you know.

Hover before you click

Check where every link really goes.

Use MFA

Never share or approve codes you didn't request.

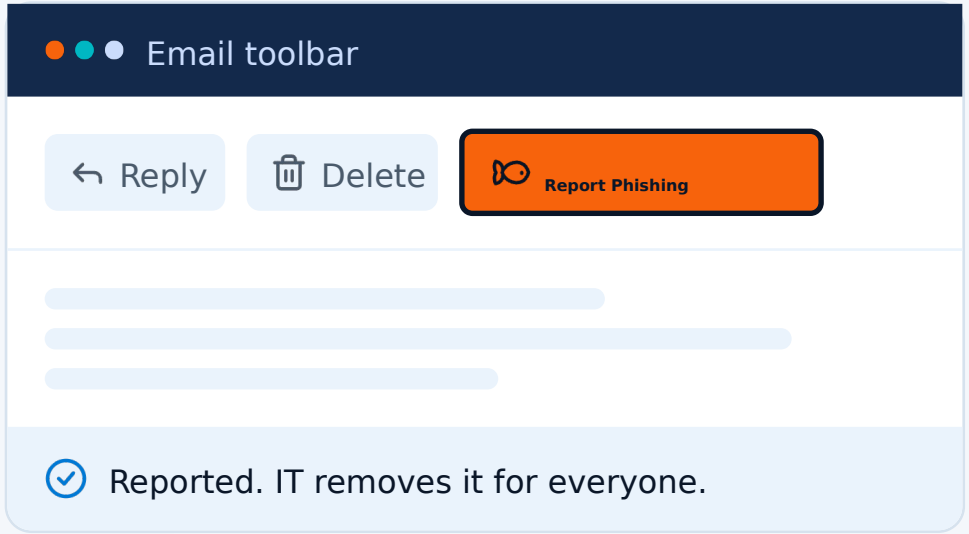

Unique passwords

A password manager makes this easy.

Report, don't delete

Reporting protects your colleagues too.

How to report phishing

Report Phishing button

[Button name]

Forward suspicious emails

[security@...]

Call IT if you clicked

[Extension]

REMEMBER

Think before you click.

Stop. Check. Report. You are our best defence.
