# Trust Nobody, Verify Everything

Zero Trust explained simply, for everyone

Presented by: **ZNexora Tech** · [Presenter] · [Date]

01 · THE OLD WAY

# Castle and moat security

**Once inside, trusted everywhere**
Anyone past the gate can reach almost anything.

**One stolen key opens the castle**
A single stolen login lets attackers walk straight in.

**The walls have disappeared**
Home working, cloud apps and phones live outside the castle.

# Attackers don't break in. They log in.

## 82%

of detections were malware-free: attackers log in with stolen credentials instead of breaking in

**CrowdStrike 2026**

## 29 min

average time for an attacker to spread once inside

**CrowdStrike 2026**

## Everywhere

we now work: home, office, cloud apps and mobile phones

THE ZERO TRUST IDEA

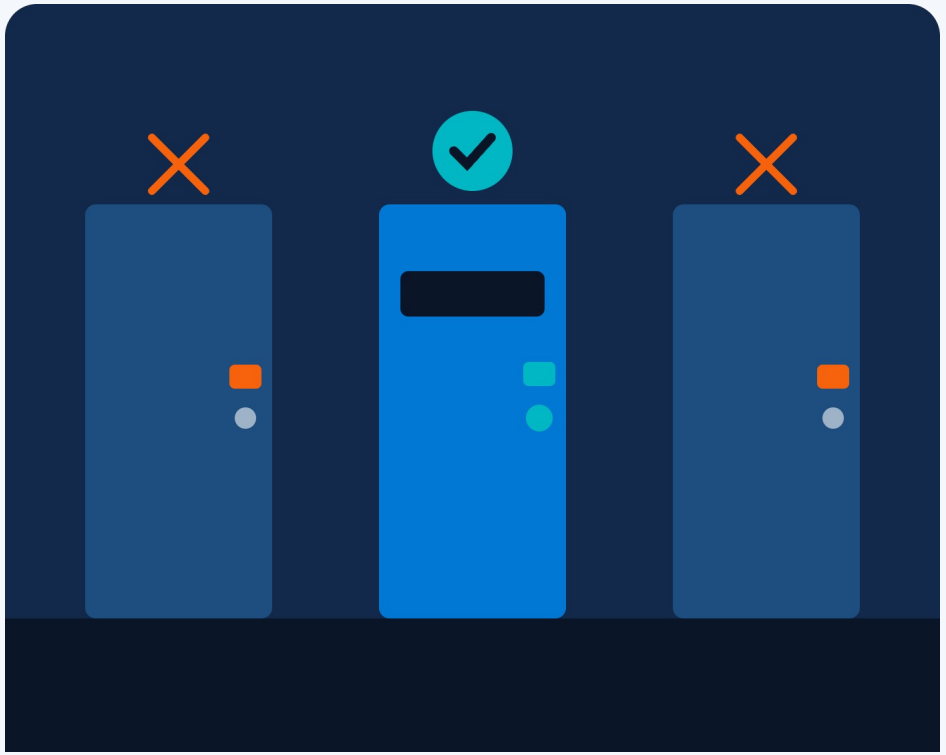

# Never trust. Always verify. Every person, every device, every time.

The term was coined in 2010 by Forrester analyst John Kindervag, and is now defined in NIST standard SP 800-207.

03 · YOU ALREADY USE IT

# Zero Trust is a hotel key card

**Check-in at the desk**
Prove who you are → Verify identity, with MFA

**Your room only**
Not every room in the hotel → Least-privilege access

**Expires at checkout**
Access stops when you leave → Time-limited sessions

**Every swipe is logged**
Unusual use is noticed → Continuous monitoring

# Three simple rules behind Zero Trust

1

## Verify explicitly

Always check who you are, your device and the situation, before granting access.

**Like an MFA code when you sign in**

2

## Least privilege

Give each person only the access they need, only for as long as they need it.

**Like a key card for one room, not the whole hotel**

3

## Assume breach

Design as if an attacker may already be inside, so one problem can't spread.

**Like fire doors that stop a fire from spreading**

# Five checks before access is granted

**Who are you?**
Identity and MFA

→

**Is your device healthy?**
Updated, encrypted, managed

→

**Where and when?**
Location, time and risk

→

**What do you need?**
Only the access required

→

**Anything unusual?**
Behaviour is monitored

All checks pass: **access granted**, for now

Something looks wrong: **extra check or blocked**

# Zero Trust in your working day

**MFA prompts**
when you sign in from a new place

**Device checks**
blocking unmanaged or outdated devices

**Access to only what you need**
not every shared folder

**Re-login requests**
sessions that expire after a while

**Blocked unapproved apps**
and USB drives

**Unusual sign-in alerts**
that ask you to confirm it was you

These aren't IT being difficult. **That's Zero Trust protecting you.**

# The old way vs Zero Trust

| | CASTLE AND MOAT | ZERO TRUST |
|---|---|---|
| **Who is trusted?** | Anyone inside the network | **No one by default** |
| **How often is it checked?** | Once, at the door | **Every request, continuously** |
| **How much access?** | Broad, often everything | **Only what you need** |
| **Stolen password?** | Attacker walks in | **MFA and device checks stop them** |
| **One device infected?** | Spreads across the network | **Contained to a small area** |

# Six ways you make Zero Trust work

### Approve only your own MFA

Never accept a prompt you didn't start

### Keep devices updated

Healthy devices pass the checks

### Use approved apps only

No personal cloud or unknown tools

### Ask only for what you need

And give back access you no longer use

### Lock your screen

Every time you step away

### Report anything odd

Strange prompts, alerts or access

QUESTIONS AND DISCUSSION

# Trust is earned, every time.

Never trust. Always verify. Report anything odd.
